#### **DETAILED ACTION**

## Response to Arguments

Applicant's arguments filed 3/25/2010 have been fully considered but they are not persuasive. The applicant argues that Song teaches away from a reflector material being coated on a ceramic body. However, the cited portion of Song fully reads "An additional inclined surface made of resin may be formed on the vertical inside surface of the ceramic body, with a metal layer coated on the inclined resin surface in an effort to overcome the above-mentioned problems. However, the inclined resin surface may be easily deformed, so it is almost impossible to form a desired reflecting surface on the ceramic body." Song is referring to a specific configuration where the reflector is being coated onto an inclined resin surface that is easily deformed. Since this specific configuration is not present in the structure of Ishinaga or Roberts, the deficiencies cited by Song are not relevant to combination in the rejection of claim 1.

Furthermore, the applicant argues that Roberts does not teach that a ceramic body is coated with reflective material; particularly that "the use of a ceramic body is only an option which is not noted as being compatible with such a metal coating." The examiner maintains that since both metals and ceramics are disclosed as being capable embodiments for use as the base 204 then the coating step would apply to each of the embodiments. It is noted that Roberts also does not *specifically* note that a metal material base 204 is compatible with the reflective coating. Hence, there is not *explicit* evidence in the Roberts that a ceramic coated with reflector material is not an intended embodiment of the invention.

## Claim Rejections - 35 USC § 103

The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.

Claims 1-2 and 5-11 are rejected under 35 U.S.C. 103(a) as being unpatentable over Ishinaga (U.S. Patent #6355946), in view of Roberts et al (U.S. Patent #6335548).

With respect to **claim 1**, Ishinaga teaches an optoelectronic component comprising a housing body and at least one semiconductor chip (Fig. 5, 3A; referenced from Fig. 3) disposed thereon, said housing body having a base part comprising a connector body (Fig. 5, 1A), on which a connecting conductor material is disposed (Fig. 5, 2a/2b), and having a reflector part comprising a reflector body (Fig. 5, 52), on which a reflector material is disposed (Fig. 5, 52a), wherein said connector body and said reflector body are preformed separately from each other and said reflector body (Fig. 5, 52) is disposed on said connector body (Fig. 5, 1A) in the form of a reflector top; and that the reflector body is coated with the reflector material (Col 5 Ln 20); but does not teach that the reflector body comprises a ceramic. Roberts teaches a housing body comprising ceramic (Fig. 10, 204 and Col 9 Ln 19-21). It would have been obvious to one of ordinary skill in the art at the time the invention was made to form the reflector

body 52 of Ishinaga from ceramic as taught by Roberts in order to improve the heat dissipation in the device (Col 9 Ln 19-27).

Furthermore, note that a "product by process" claim is directed to the product per se, no matter how actually made, In re Hirao, 190 USPQ 15 at 17 (footnote 3). See also In re Brown, 173 USPQ 685; In re Luck, 177 USPQ 523; In re Wertheim, 191 USPQ 90 (209 USPQ 554 does not deal with this issue); In re Fitzgerald, 205 USPQ 594, 596 (CCPA); In re Marosi et al., 218 USPQ 289 (CAFC); and most recently, In re Thorpe et al., 227 USPQ 964 (CAFC, 1985) all of which make it clear that it is the final product per se which must be determined in a "product by process" claim, and not the patentability of the process, and that, as here, an old or obvious product produced by a new method is not patentable as a product, whether claimed in "product by process" claims or not. In this case the limitation wherein said connector body and said reflector body are preformed separately from each other" is a product by process limitation. Note that Applicant has burden of proof in such cases as the above case law makes clear. As to the grounds of rejection under section 103, see MPEP § 2113.

With respect to **claim 2**, note that a "product by process" claim is directed to the product per se, no matter how actually made, <u>In re Hirao</u>, 190 USPQ 15 at 17 (footnote 3). See also <u>In re Brown</u>, 173 USPQ 685; <u>In re Luck</u>, 177 USPQ 523; <u>In re Wertheim</u>, 191 USPQ 90 (209 USPQ 554 does not deal with this issue); <u>In re Fitzgerald</u>, 205 USPQ 594, 596 (CCPA); <u>In re Marosi et al.</u>, 218

USPQ 289 (CAFC); and most recently, In re Thorpe et al., 227 USPQ 964 (CAFC, 1985) all of which make it clear that it is the final product per se which must be determined in a "product by process" claim, and not the patentability of the process, and that, as here, an old or obvious product produced by a new method is not patentable as a product, whether claimed in "product by process" claims or not. Note that Applicant has burden of proof in such cases as the above case law makes clear. As to the grounds of rejection under section 103, see MPEP § 2113.

With respect to **claims 5-7**, Ishinaga teaches that the connecting conductor (Col 3 Ln 60) material is different from said reflector material (Col 5 Ln 19-23).

With respect to **claim 8**, Ishinaga teaches that the connecting conductor material contains Au (Col 3 Ln 65), but does not teach that the reflector material contains silver. Roberts teaches reflector material containing silver (Col 10 Ln 26-28). It would have been obvious to one of ordinary skill in the art at the time the invention was made to provide a reflector material containing silver in the device of Ishinaga as taught by Roberts in order to increase the reflectivity of the material (Col 10 Ln 26-30).

With respect to **claim 9**, Ishinaga teaches that said housing body has cavity in which said semiconductor chip is disposed (Fig. 5, cavity formed in 52).

With respect to **claim 10**, Ishinaga teaches that said reflector body is provided with a recess (Fig. 5, recess of 52), said recess is part of the cavity of

the housing body and said reflector material (Fig. 5, 52a) is disposed on a wall of said recess.

With respect to **claim 11**, Ishinaga teaches that said reflector material is electrically insulated from said connecting conductor material (Col 5 Ln 19-23, the reflector material can be an insulating material).

Claims 4 and 22 are rejected under 35 U.S.C. 103(a) as being unpatentable over Ishinaga, in view of Wakisaka et al (U.S. PG Pub #2002/0121671).

With respect to **claim 4**, Ishinaga does not teach that said housing body contains aluminum nitride or aluminum oxide. Wakisaka teaches an aluminum nitride (Paragraph 43) for use as a housing substrate (Fig. 1B, 1). It would have been obvious to one of ordinary skill in the art at the time the invention was made to use aluminum oxide in the housing body of Ishinaga in order to provide a ceramic substrate having an insulating characteristic and high heat conductivity (Paragraph 43).

With respect to **claim 22**, Ishinaga teaches an optoelectronic component comprising a housing body and at least one semiconductor chip (Fig. 5, 3A; referenced from Fig. 3) disposed thereon, said housing body having a base part comprising a connector body (Fig. 5, 1A), on which a connecting conductor material is disposed (Fig. 5, 2a/2b), and having a reflector part comprising a reflector body (Fig. 5, 52), on which a reflector material is disposed (Fig. 5, 52a), wherein said connector body and said reflector body are preformed separately

from each other and said reflector body (Fig. 5, 52) is disposed on said connector body (Fig. 5, 1A) in the form of a reflector top; and that the reflector body is coated with the reflector material (Col 5 Ln 20); but does not teach that the reflector body comprises a ceramic. Song teaches a housing body comprising ceramic (Fig. 10, 204 and Col 9 Ln 19-21). It would have been obvious to one of ordinary skill in the art at the time the invention was made to form the reflector body 52 of Ishinaga from ceramic as taught by Roberts in order to improve the heat dissipation in the device (Col 9 Ln 19-27).

Furthermore, Ishinaga does not teach that said housing body contains aluminum nitride or aluminum oxide. Wakisaka teaches an aluminum nitride (Paragraph 43) for use as a housing substrate (Fig. 1B, 1). It would have been obvious to one of ordinary skill in the art at the time the invention was made to use aluminum oxide in the housing body of Ishinaga in order to provide a ceramic substrate having an insulating characteristic and high heat conductivity (Paragraph 43).

Claims 12, 13, 17, 18, 20, 23, and 24 are rejected under 35 U.S.C. 103(a) as being unpatentable over Ishinaga and Roberts, in view of Song et al (U.S. Patent #6707069).

With respect to **claims 12 and 20**, Ishinaga does not teach an insulation part disposed between said base part and said reflector part, the insulation part comprising a ceramic. Song teaches a ceramic insulation layer between a base

part and a reflector part (Fig. 4a, 151b and Col 6 Ln 56-57). It would have been obvious to one of ordinary skill in the art at the time the invention was made to provide a ceramic insulation layer between a base part and a reflector part of Ishinaga as taught by Song in order to provide a chip mounting area (Col 6 Ln 59-60).

With respect to **claims 13, 23, and 24**, note that a "product by process" claim is directed to the product per se, no matter how actually made, <u>In re Hirao</u>, 190 USPQ 15 at 17 (footnote 3). See also <u>In re Brown</u>, 173 USPQ 685; <u>In re Luck</u>, 177 USPQ 523; <u>In re Wertheim</u>, 191 USPQ 90 (209 USPQ 554 does not deal with this issue); <u>In re Fitzgerald</u>, 205 USPQ 594, 596 (CCPA); <u>In re Marosi et al.</u>, 218 USPQ 289 (CAFC); and most recently, <u>In re Thorpe et al.</u>, 227 USPQ 964 (CAFC, 1985) all of which make it clear that it is the final product per se which must be determined in a "product by process" claim, and not the patentability of the process, and that, as here, an old or obvious product produced by a new method is not patentable as a product, whether claimed in "product by process" claims or not. Note that Applicant has burden of proof in such cases as the above case law makes clear. As to the grounds of rejection under section 103, see MPEP § 2113.

With respect to **claims 17 and 18**, Ishinaga does not teaches that said base part includes a heat sink. Song teaches a base for an LED chip that includes a heat sink (Fig. 4, H1) that is electrically insulated from said semiconductor chip (by part 151b). It would have been obvious to one of

Application/Control Number: 10/593,794 Page 9

Art Unit: 2826

ordinary skill in the art at the time the invention was made to provide a heat sink in the base part of Ishinaga as taught by Song in order to dissipate heat from the chip.

Claims 14-16 are rejected under 35 U.S.C. 103(a) as being unpatentable over Ishinaga and Roberts, in view of Harada (U.S. PG Pub #2003/0230751).

With respect to **claims 14 and 16**, Ishinaga does not teach disposed on said base part, particularly after said reflector part, is an adhesion promoting part provided with a recess that is part of the cavity of said housing body. Harada teaches an adhesion promoting part (Fig. 2, side cavities of body 4) disposed on a base part provided with a recess that is part of a cavity, and an envelop (Fig. 2, 8) that adheres better to said adhesion promoting part (due to a contact surface being larger between the envelop 8 and base 4) than it does to a reflector material (Fig. 2, 7). It would have been obvious to one of ordinary skill in the art at the time the invention was made to provide an adhesion promoting part in the device of Ishinaga as taught by Harada in order to control the direction of the emitted light.

With respect to **claim 15**, Ishinaga teaches that disposed in the cavity is an envelop that at least partially envelops said semiconductor chip (Fig. 5, 50).

#### Conclusion
